

Leedum are delighted to announce the introduction of a new range of seat piping to meet the requirements of motor manufacturers who need to produce a flawless product, reliably and cheaply.

Conventional notched piping will follow a gentle contour reasonably well but when the bends are more pronounced, the piping flange 'bunches' and causes the piped seam to twist and pucker.

Leedum have introduced a new specially notched piping designed to follow the tightest curves closely and smoothly without twisting.

The secret lies in the assymetrical notched vee in the piping flange. The 30 degree cuts allow the piping to bend evenly while the straight cuts support the piping flange. This means that fairly tight curves can be acheived without twisting.

As well as ensuring an improved piped seam, the use of Easyflex piping makes the whole machining operation much easier for the operator.

*patent applied for

	Piping Core	Flange
Dimension	3mm - 4.5mm dia.	10mm - 20mm
Materials	Polyethylene Polypropylene Parvic (Solid or Hollow)	Leathercloth Fabric Leather
